

### Claims

5       The machine for gravitational processing of mineral deposits  
consisting of box with jigging sieve and tub with working medium, drive,  
unit for loading material to be processed, units for unloading products  
processed, unit for delivering working medium, one or more elastic elements  
and support being different due to the fact that to achieve stability and  
10 intensification of the jigging process, box with jigging sieve and tub with  
working medium are being connected between each other movably by one  
or more rigid elements, at least one of the rigid elements is leaning on the  
support movably, one or more elastic elements connect either two or more  
mobile parts of the machine between each other or the support with one  
or more mobile parts of the machine.
